River and delta morphodynamics

Introduction

- Bifurcations unstable?
- Difference between gravel- and sand-bed rivers?
- see posters Marra et al. EP31C-0749 Wednesday 8:00 am, Lavooi et al. EP51C-0560 Friday 8:00 am, talk Gupta et al. EP24B-06 Tuesday 4:00 pm

Braided River (Tagliamento River)

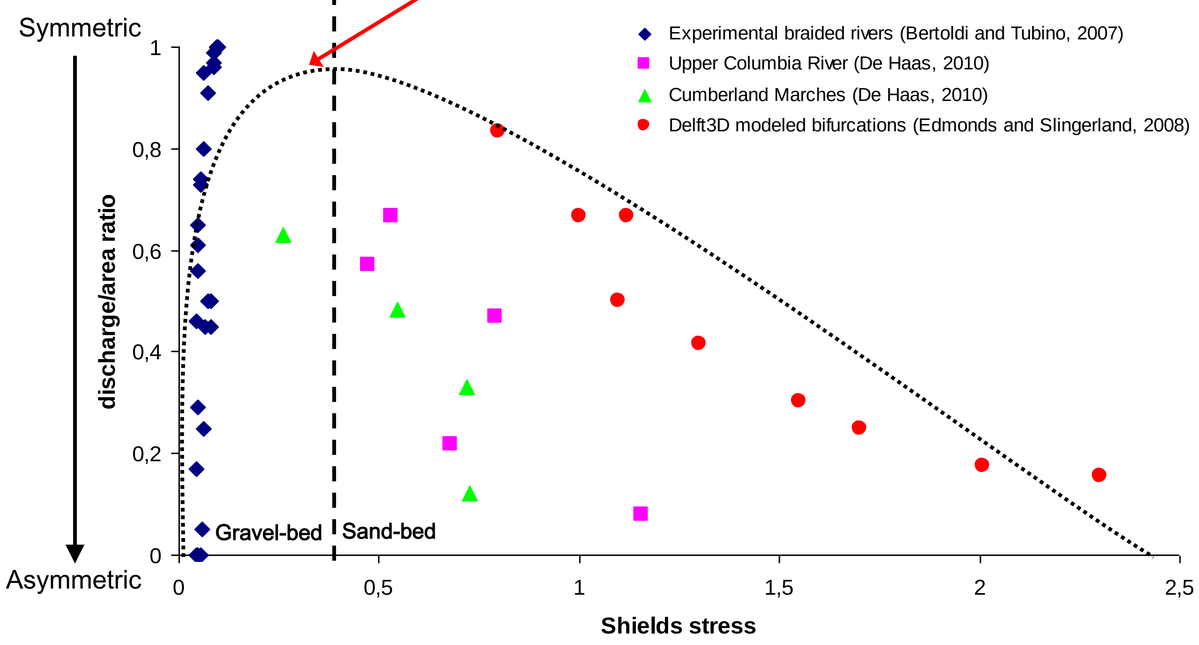
Meandering River (Rhine River)

Anastomosing River (Columbia River)

River delta (Cumberland Marshes)

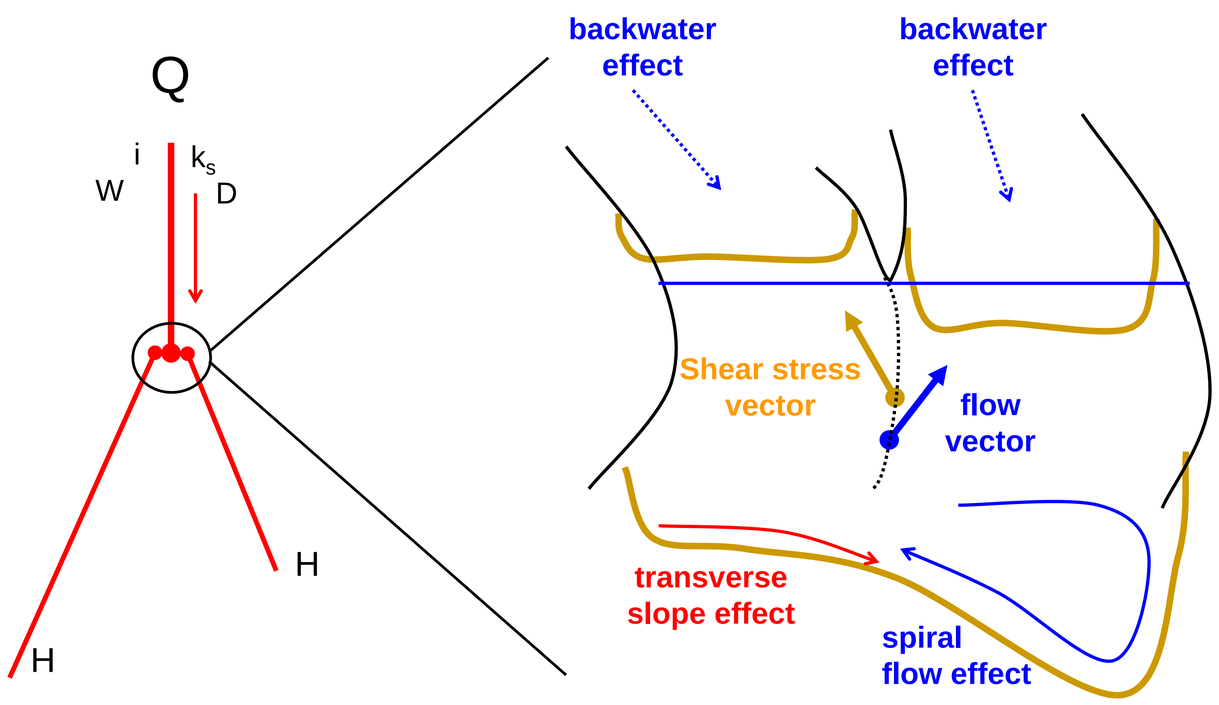
Problem definition

- Opposite trend gravel- and sand-bed rivers
- Hypothesis: connected by optimum?



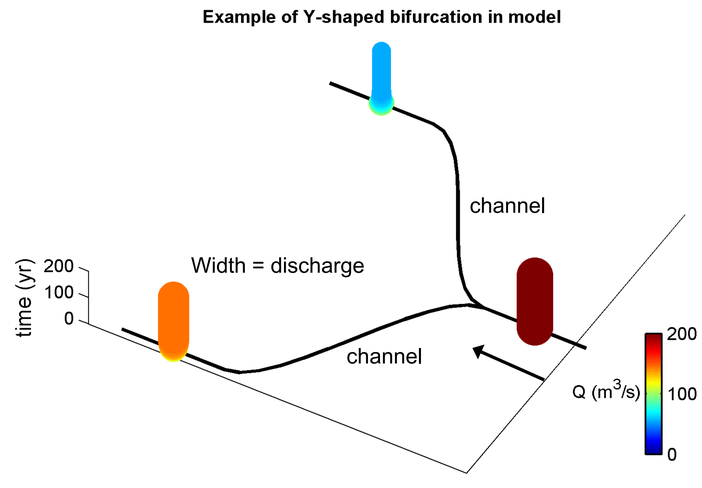
Model

- 1D network model with Y-shaped bifurcation:
  - Gradually varied flow, bedload transport and morphological change
  - Width: *f*(Q), mass conserved
  - Flow and sediment division: transverse slope effect and spiral flow effect caused by bend

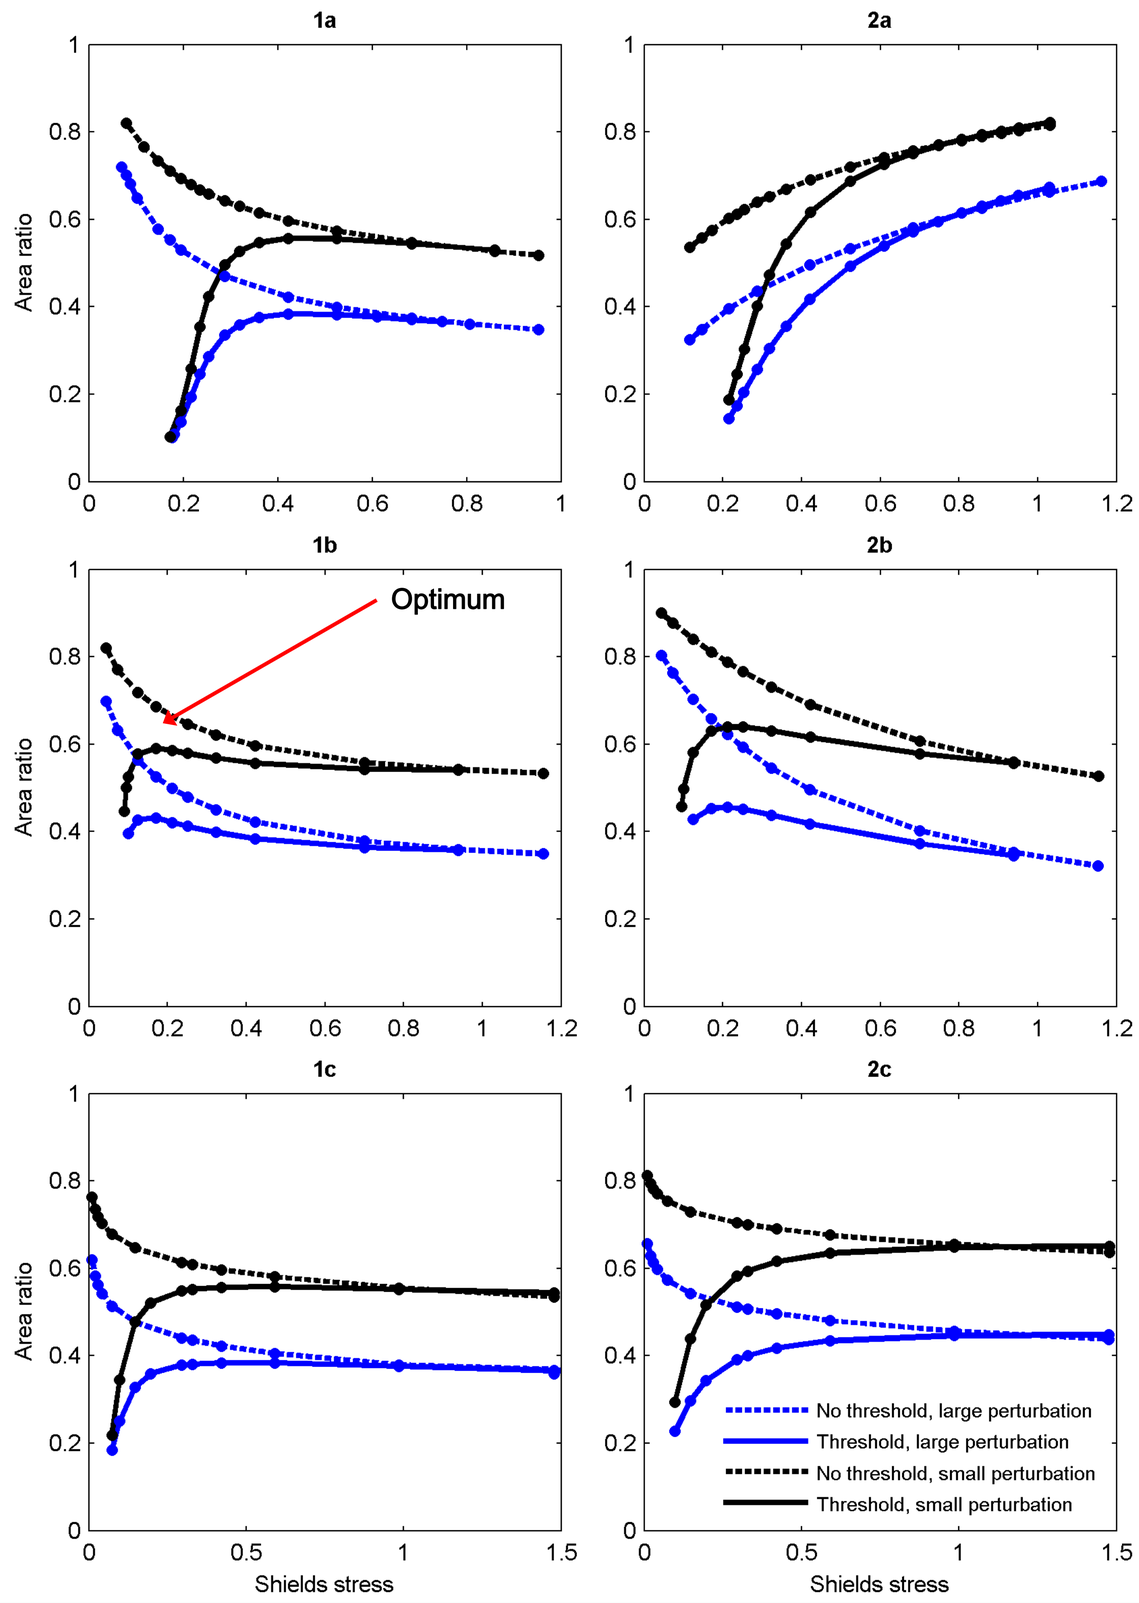


Model scenarios

- Bifurcations unbalanced:
  1. Bend at bifurcation
  2. Gradient advantage
- Mobility increased:
  a. Discharge
  b. Channel gradient
  c. Particle size
- Sediment transport
  - —— Including threshold for sediment motion
  - -- Excluding threshold for sediment motion



Results



Conclusions

- Threshold for motion → Optimum
  - Gravel-bed rivers → Shields stress lower than optimum
  - Sand-bed rivers → Shields stress higher than optimum
- Opposite trend explained!
