

## Introduction

Fig. 1 Schematic drawing of stomata and gas exchange. Optimality modelling describes the trade-off of carbon gain versus water loss through the least-cost hypothesis, described in the formula above. A = photosynthesis, E transpiration, and a and b are unitless cost factors.

Eco-evolutionary optimality (EEO) states that plants adapt or acclimate to their environment, thereby eliminating uncompetitive plant strategies by natural selection. EEO has been proven successful for developing hypotheses and models of the terrestrial biosphere. On a plant leaf level, EEO theory is used to analyze and model plant processes including photosynthesis, gas exchange, and stomatal behavior. Plants regulate their gas exchange by dynamically adjusting their stomata on a short term time scale (opening and closing) and long term time scale (stomatal size and density), which also influences photosynthetic capacity. The operational stomatal conductance  $(G_{op})$  is determined by the opening state of the stomata during typical growth conditions. The anatomical maximum stomatal conductance (G<sub>smax</sub>) results from the maximum stomatal aperture, stomatal density and pore depth.

### Aims:

- test photosynthesis exchange and gas responses to elevated CO<sub>2</sub>
- combine biochemical (Fig.1) and morphological (Fig.2) responses in one framework
- test optimality model with results

This poster presents the preliminary results

Host facility: University of Western Australia, Per climate chamber, 9 plants per species Perth

Two climate controlled growth rooms:

- 12 hours day length
- 700 PAR
- 30 degrees Celsius
- CO<sub>2</sub> concentration: 400 and 1000 ppm
- 6 species (see table A)

were grown in 1 liter pots. Measuremen started when first fully mature leave appeared. Measurements were made wi a Licor portable photosynthesis syste (LI6400 and LI6800). Imprints of t cuticle for microscope analysis were made with nail varnish., to derive G<sub>smax</sub>.

Fig. 2 Conceptual framework after Franks et al. (2012). Operational stomatal conductance (Gc(op)) operates on Gc(max) curve by opening/closing the stomata. Subambient or elevated CO2 levels will results in increase in Gc(max) or decrease in Gc(max). Gop will shift along the new curve to return to high sensitivity region (a to b to c for elevated levels, a to d to e for subambient levels).

Photosynthesis	Class
C3	Eudicot
C3	Eudicot
C3	Eudicot
C3	Monocot
C4	Monocot
C3	Eudicot (woody species)

Measurement environment	Replicates
Ambient environment	3-5 per group
Saturating light (1000 PAR)	5 per group
(to check for ACi's)	~2 per group
Ambient environment	8/9 per group
Nail varnish	8/9 per group
ACi measured leaf	8/9 per group
Ambient + saturating light (1000 PAR)	8/9 per group

# **Biochemical preliminary results (continued)**

Fig. 7. Boxplot of operational stomatal conductance (Gop) of five species, showing a significant species effect (P < 0.05), but no significant treatment effect. AC = ambient CO<sub>2</sub> (400 ppm), HC = elevated CO<sub>2</sub> (1000 ppm)

 $\rightarrow$  So, A<sub>max</sub> significantly increases at elevated CO<sub>2</sub> levels. G<sub>op</sub> slightly decreases, but not

## Conclusions

Plants adapt their biochemistry and morphology at elevated CO<sub>2</sub> levels. Photosynthesis traits, V<sub>cmax</sub> and J<sub>max</sub> decrease (Borlotti bean), while operational maximum photosynthesis rates increase (all species). Morphologically, stomatal density responses varies between the species, and remaining analyses should reveal patterns in G<sub>smax</sub> responses, as well as patterns in biochemical responses. This shows that different morphological and biochemical strategies can results in the same enhances photosynthetic rate at elevated CO<sub>2</sub>. It should also be noted that responses in morphology may be more consistent between species on longer

## Outlook

- Connect this research to herbarium analysis to compare the results on different (longer) timescales
- Use results to test and improve the P-model
- Use results to identify/ confirm potential plant physiological constraints in the Pmodel (based on paper 1 of thesis
